That doesn't necessarily mean you need to master all three, but understanding the general function of server-side languages can provide extra context for PHP.How to Learn PHPLearning PHP requires some familiarity with how computer code and programming languages work. More Computerworld QuickStudies PHP fans say the language is exceptionally easy to learn. For professional-level quality assurance and testing, Crothers advocates using a product such as Komodo from Vancouver, British Columbia-based ActiveState Corp. "It does everything," he says. However, improvements are in the works for PHP Version 5.0, he said, which is due sometime in the second quarter. Komodo's integrated development environment is available free to individuals and nonprofit organizations. The clicking, scrolling and typing you do on the visible portion of a webpage is interaction with the website's front end, or client side. "You will also see some nice ways to build [Simple Object Access Protocol/Web Services Description Language] services with PHP," he says. Learning PHP takes time and patience as you'll need to not only understand the specifics of the language but also the tech jargon that surrounds it.What Can You Do With PHP?As a server-side language, PHP can allow you to do a lot of important work on a website's back end. This Online Book Store Project Report In PHP includes an admin section and the user section. This Online Book Store In PHP aims to increase online book sales because the Internet plays such an important part in people's lives nowadays.A Online Book Store Project In PHP Synopsis is a really useful and time-saving tool for book sellers who want to sell their books online and make a lot of money. He also acknowledges that PHP's object-oriented programming capability, compared with that of Java, for example, "is not as powerful as it should be." This can make PHP a bit more cumbersome for creating very large-scale applications. For hiding code or creating applications for resale, products such as Zend's Encoder will mask some work. PHP, a back-end language, isn't about making things look nice the way front-end languages like CSS are.Other Server-Side LanguagesPHP is not the only server-side programming language out there. "If we didn't have PHP, it would cost us six to seven times as much to operate [our] IT environment," says Kevin Crothers, head of corporate Web systems at WorldCom Inc. PHP is an interpreted language and doesn't use compiled binary executables, so PHP applications can be more easily viewed and dissected by competitors, says Crothers. "It's all LDAP-based," he says, noting that PHP had "the strongest LDAP integration we've been able to find." PHP uses server resources efficiently, Crothers says. This multiplatform support appeals to IT managers who don't want to be locked into a single brand. That doesn't appeal to every Web development shop, but Suraski says he believes some PHP authoring tools will be out later this year. For example, if you log into your bank account using a secure password, there's a part of that transaction you see (e.g., the text boxes labelled "username" and "password") and a part you don't see, which involves communication of your request to a server, which verifies your username and password, deems them valid and allows you to proceed. So if you're interested in the nitty gritty of what makes the web run rather than worrying about making things look nice and make sense for users, PHP would be a good language to learn. In short, PHP is a server-side coding language that uses a format known as scripting. WorldCom has used PHP for several major Web projects, both internal and external, including the front end to a searchable database of employees and contractors that contains more than 100,000 records. It has a lot of built-in functions such as simple connections to databases and support for the Lightweight Directory Access Protocol (LDAP). After logging into the framework, the user can check for books in various categories, each of which includes a sub category where the user can look further. It uses memory sparingly and allows client-side interpretation of code to shoulder some processing burden. So, he says, he wrote "a very simple parser" to replace tags in an HTML file with some code he'd written in C. At present, there are no high-level commercial WYSIWYG Web authoring tools that automatically generate PHP pages, which means you need actual programming knowledge. Crothers adds that he has found PHP to be both stable and secure, and he believes that the language is very easy to learn compared with competing technologies such as Microsoft Corp.'s Active Server Pages (ASP) technology for dynamic Web applications. Above is an example of simple PHP code for e-mailing data entered into an HTML form, where the form has fields called comments (for comments entered by a user) and frommail (for a user-entered e-mail address), as well as a hidden field tomail (for the address where information should be sent). Back-end development is the process of building the unseen architecture that allows a website or app to function. PHP is or has been behind some of the largest web businesses in the world, including Facebook and WordPress.The Two Sides of Web ProgrammingThe average website or app user doesn't necessarily think that much about what goes on when they click a button, enter text in a box or scroll through results pages. You can dive right into a free or paid PHP tutorial, but if you aren't at least a little bit tech literate, you may be out of your depth. . "Very powerful applications can be created in a very short time. See additional Computerworld QuickStudies Copyright © 2002 IDG Communications, Inc. Room for Improvement However, many developers generate ASP code from software such as Microsoft's Visual InterDev, which can be easier for nonprogrammers than coding in PHP, Suraski notes. That project evolved into PHP, an open-source scripting language now installed at more than one in every five Web domains, according to an October 2001 survey of more than 6 million domains conducted by Netcraft, a Bath, England-based Internet consulting company. Lerdorf says other upcoming improvements include making PHP Extension and Application Repository (PEAR) more useful. No, that's not a double entendre. As compared to a traditional bookstore, it is more effective, convenient, and requires less effort. PHP is a programming language used for server-side web development. The e-mail would be sent with the subject line "User Comments." In a production environment, additional code would be added for validation and security. If you really want to gain an understanding of what PHP does and why, it may make sense to study up on these other languages as well. All of that unseen communication is a server-side or back-end activity. Ultimately, Crothers says, PHP is an excellent environment for creating Web applications for WorldCom. PEAR solves some Web-related problems but isn't part of PHP itself. Just a little bit of typing or clicking and information appears like magic. "There's money in your pocket right there," he says, because a PHP-based application requires less server hardware than some other environments. Of course, it isn't magic. All of the behind-the-scenes communication between different servers to retrieve and display information happens on the back end, or server side. If this doesn't make sense to you, or if you still aren't quite sure what PHP programming is for, keep reading to learn more.Understanding PHPWeb development topics can be pretty complicated for people who aren't at least a little bit familiar with them, so it's best to start with a simple explanation. Free and Easy As open-source software, PHP is free for corporate use and works well with other popular open-source projects, including the Apache Web server and the MySQL and PostgreSQL databases. Others, like Ruby and Python, may be equally or more important in different situations.
